

Circulation Pump Modification For Pre-2002 Models

A restrictor (6540-038) needs to be installed into the 3/4" tubing on the discharge side of the circulation pump (between the circulation pump and heater) and secured with a 3/4" hose clamp (6570-033) when a Laing E-10 circulation pump is installed as a replacement. The Laing E-10 model circulation pump is equipped with a priming feature that can be inadvertently triggered when **jet pump** one is activated which can deactivate the circulation pump until the spa is powered off and back on. Adding this restrictor alleviates this issue. The restrictor uses a 5/16" diameter hole and can be made out of a standard manifold plug if necessary. *(Posted December 7, 2012)*
